

SEPTEMBER 2026

Everyone gets a handful of crumbs to share.

A private way for a group to decide how money gets shared out. Everyone gets the same handful of crumbs to give to the people or projects they think deserve them. Nobody sees where anyone's went until everyone has given, then it all opens at once.

THE PROBLEM

Four people, one pot of money, and no good way to split it.

Someone says a number first, and it becomes the number everyone edges away from.

The loud work gets counted. The quiet work that held it together does not.

When everyone can see who gave what, giving turns into trading favours.

Or it goes to a show of hands, and the best known person wins.

THE SOLUTION

Critter Crumbs changes one thing. Nobody sees who gave what until it is all in.

There is no first number to react to. Everyone gives at the same time, in private.

Everyone writes what they did, and it all opens at once, so quiet work gets read.

Nobody can see what you gave, so there is nothing to trade back.

Nobody can see which way others are leaning, so nobody follows the crowd.

In Critter Crumbs your group is a **burrow**. You give **crumbs** to **critters**, the people or budget lines being shared between. What you give is your **scatter**, and the **feast** is the moment every scatter opens.

Built first for one council of 6–10 people. It fits any group that shares out money or credit: a co-op, a grant programme, a project team.

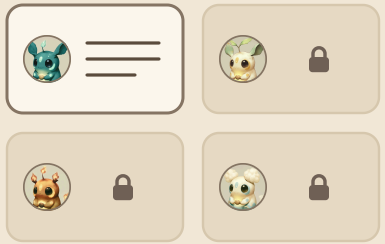

A feast, start to finish.

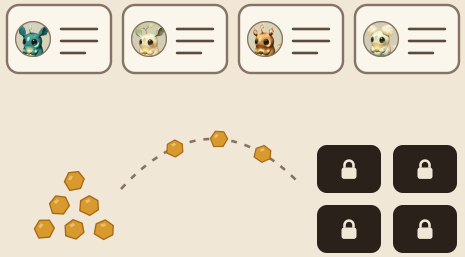

Write what you did. Give your crumbs. Then everything opens at once.

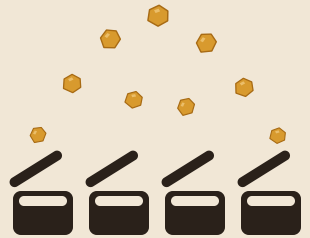

Gathering closes

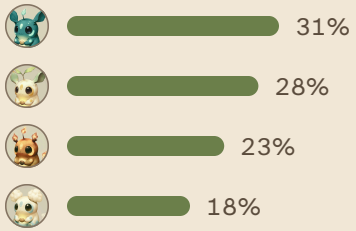

Scattering closes

1 **Start a feast**
Say what is being shared. Everyone gets 100 crumbs.

2 **Gathering**
Everyone writes down what they did.

3 **Scattering**
Read every statement, then give all your crumbs away.

4 **The feast**
Every scatter opens at once, on every device.

5 **The result**
Each share of the pot, the same on every screen.

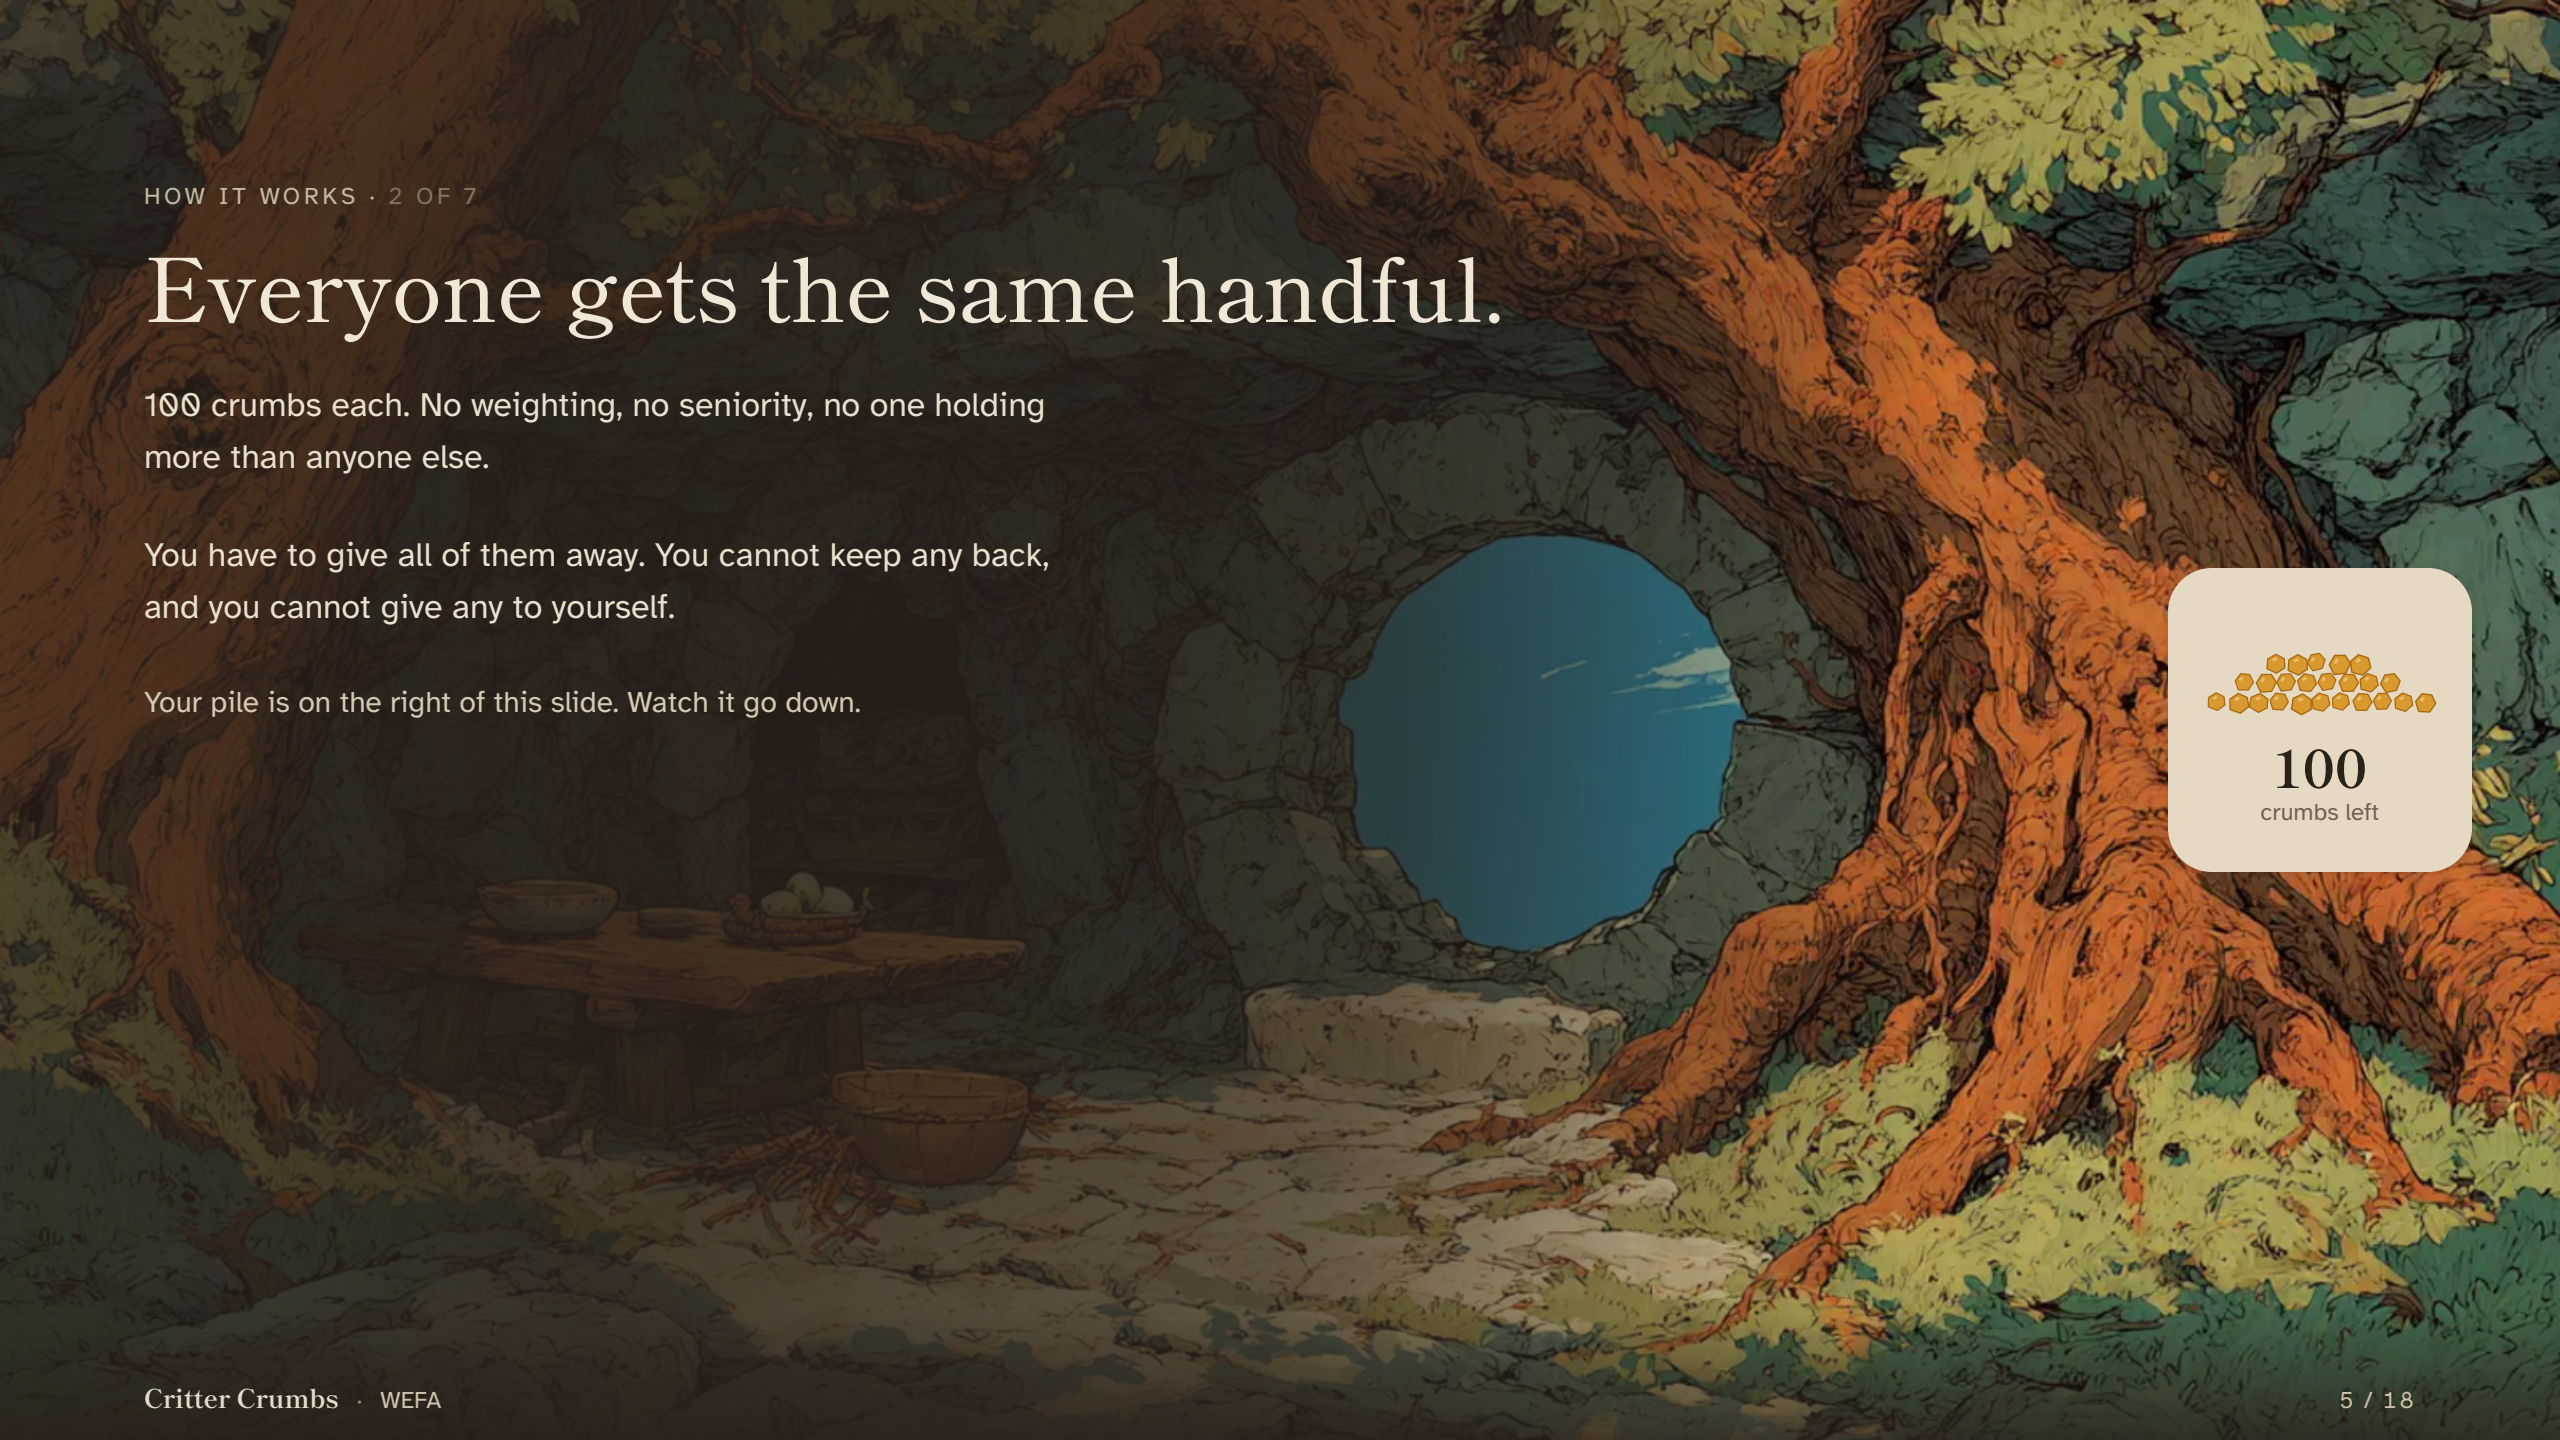

WHAT YOU WRITE	Only you can read yours	Everyone in the burrow can read them all
WHERE YOUR CRUMBS GO	Nobody sees them. Not even us.	Everyone sees the same totals

Everyone gets the same handful.

100 crumbs each. No weighting, no seniority, no one holding more than anyone else.

You have to give all of them away. You cannot keep any back, and you cannot give any to yourself.

Your pile is on the right of this slide. Watch it go down.

You do not fill in a form. You feed.

Fern 12

Ran the grants desk all year

− 12 +

Tap a critter and it gets one crumb. It squashes, chews, and swallows.

Hold, and crumbs pour. About three seconds to empty a full pile.

Given too many? Take some back. Minus works exactly the same way.

There is a number field too, for anyone who wants to give exactly 33.

88
crumbs left

People are critters. So are budget lines.

Your critter is made from your account, so it is the same critter in every burrow you belong to. You meet it once and you keep it. A budget line gets one too, and it grows when it is fed.

Water

Fin ears, and the teal of a shaded pool.

Earth

Leaf ears, and a sprout growing between them.

Fire

Flame tufts, and an ember at the tail.

Air

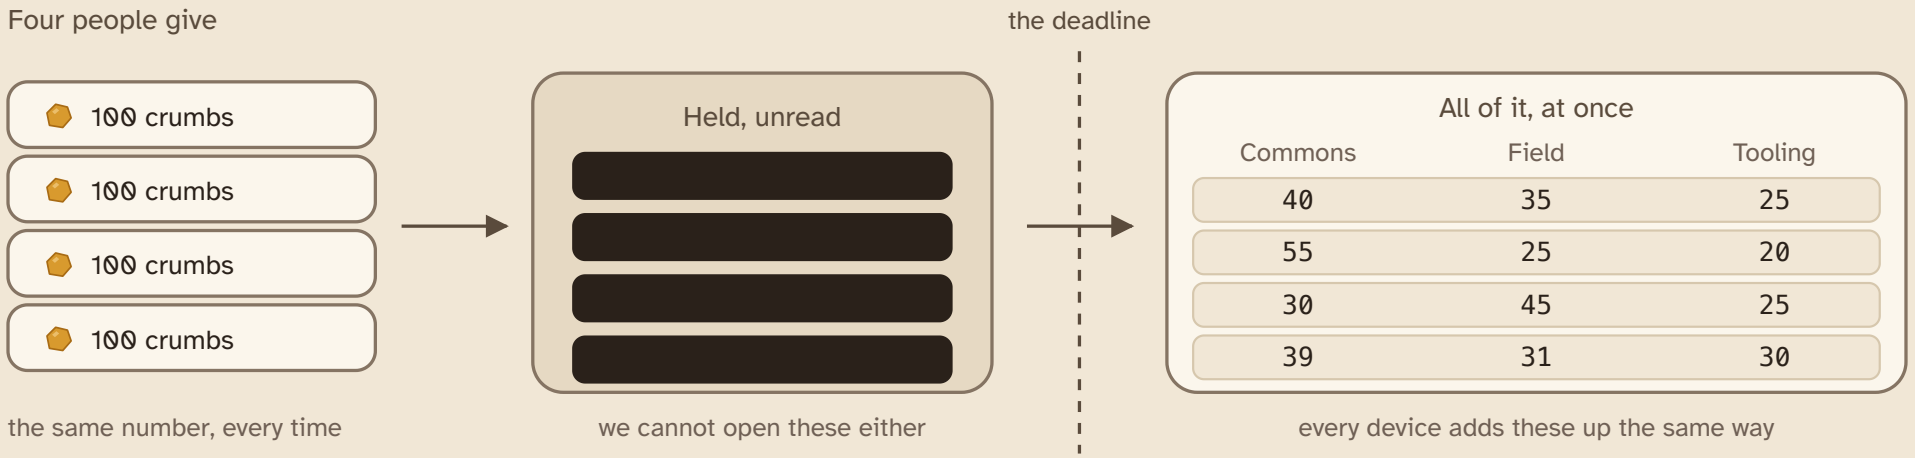

Cloud ears, and it never quite touches the ground.

75

crumbs left

Nothing opens early.

Tooling	100	

Three phases, two deadlines.

Gathering closes in 2 days

Scattering closes in 5 days

Gathering	Everyone writes down what they did. Nobody can read anyone else's yet, and you can keep editing yours.
Scattering	Every statement opens at the same moment. You read them, then you give. You can change your mind right up to the deadline.
The feast	Everything opens. The critters wake and grow, and the numbers are there.

46
crumbs left

Both deadlines stay on screen, in your own time zone. The clock is the server's, not your phone's. Nobody starts the feast. It arrives.

Five rules, and the app holds everyone to them.

Equal crumbs	Everyone in a feast gets the same number. The creator picks it once, and 100 is the usual answer.
Give all of them	You cannot submit with crumbs left in your hand.
Never to yourself	You cannot give crumbs to yourself. Your own critter still receives whatever everyone else gives it.
Sitting out costs nothing	You still receive. The burrow is simply told that you did not give.
Shares come from what was given	Shares are worked out from the crumbs people actually gave, so someone who sits out cannot water everyone else down.

THE FEAST

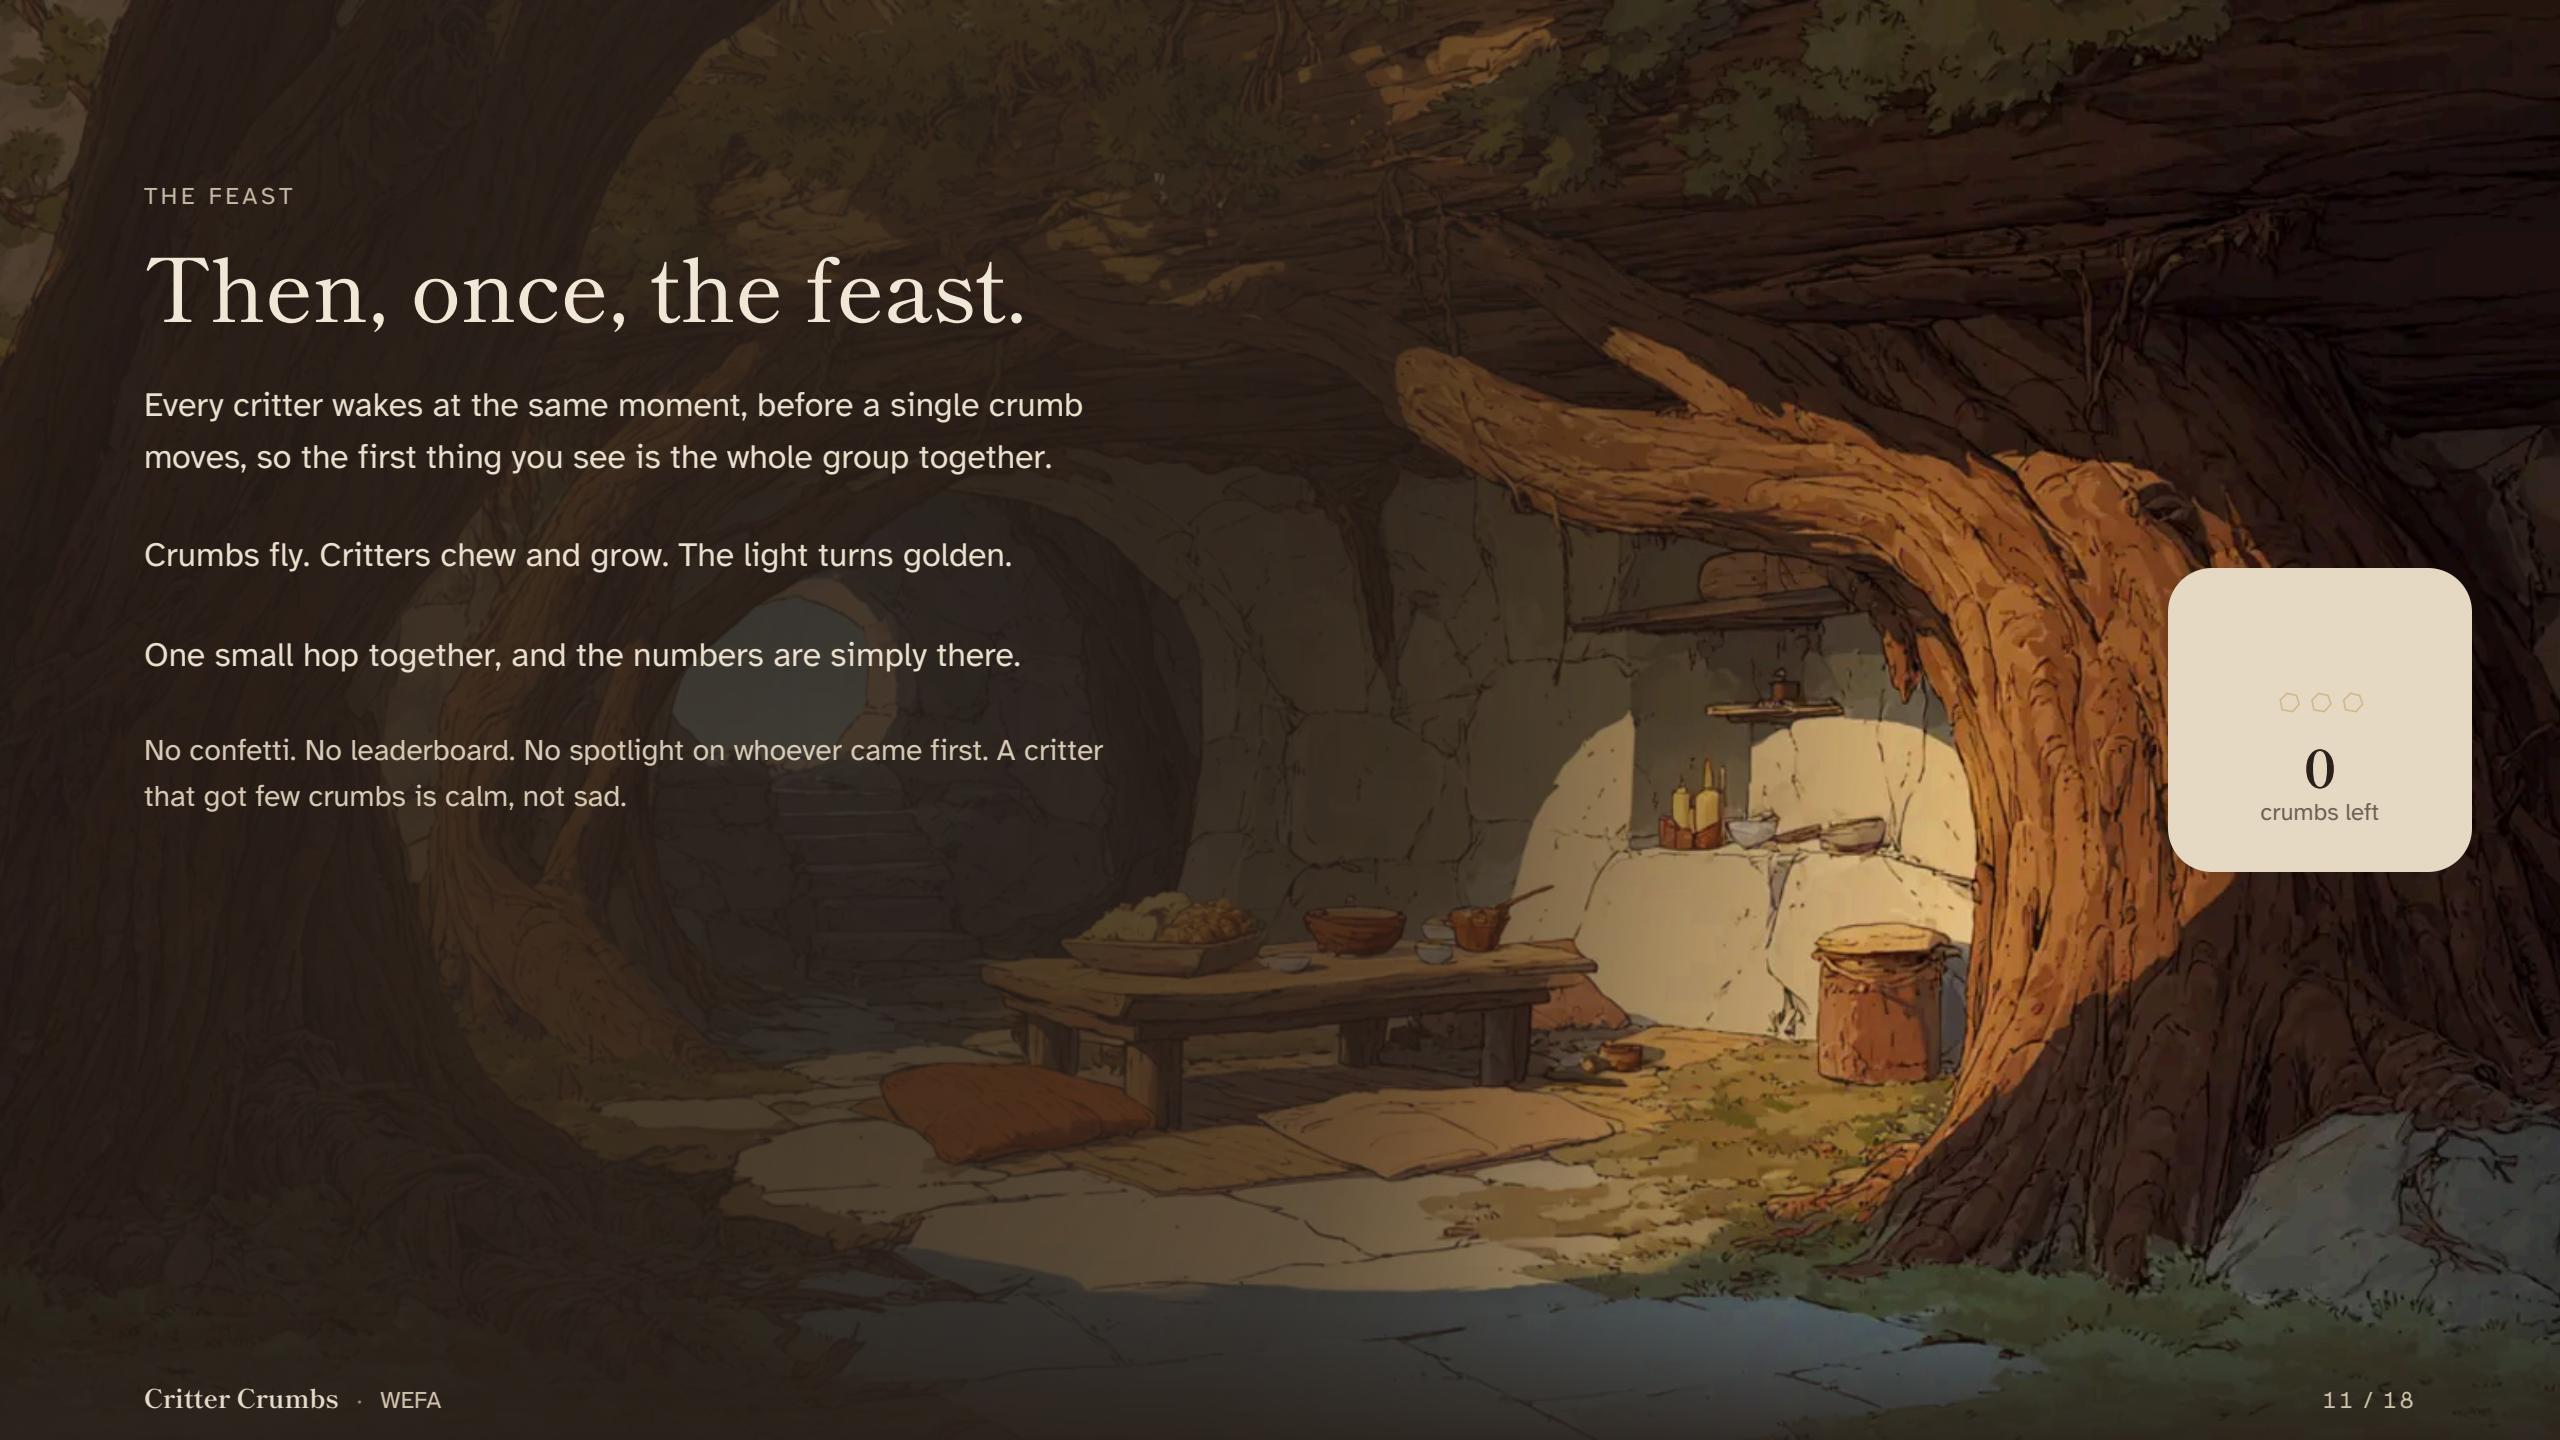

Then, once, the feast.

Every critter wakes at the same moment, before a single crumb moves, so the first thing you see is the whole group together.

Crumbs fly. Critters chew and grow. The light turns golden.

One small hop together, and the numbers are simply there.

No confetti. No leaderboard. No spotlight on whoever came first. A critter that got few crumbs is calm, not sad.

0
crumbs left

What you are promised.

No one can read what you gave until the feast	Your crumbs are locked to a time, not to a person. A group of independent key holders releases the key when the deadline passes, and not a moment before. There is nobody to ask for it early.
We cannot make one up	Yours is signed by you. One we invented would not carry your signature.
We cannot quietly lose one	The full list goes up the moment scattering closes. Check that yours is on it.
Everyone gets the same numbers	The count runs on your own device. There is no server answer for anyone to argue with.
Nothing about you is measured	No analytics and no telemetry. The app never records what you looked at, how long you took, or what you clicked. It makes the network requests it needs to do its job, and nothing else.

What a burrow can choose.

WHO GAVE WHAT
Your burrow, after the feast

A PUBLIC RECORD
Optional

The two switches are independent, so every pairing is available. Two things never change: whether you took part is visible to your burrow from the start, and where your crumbs went is hidden from everyone until the feast.

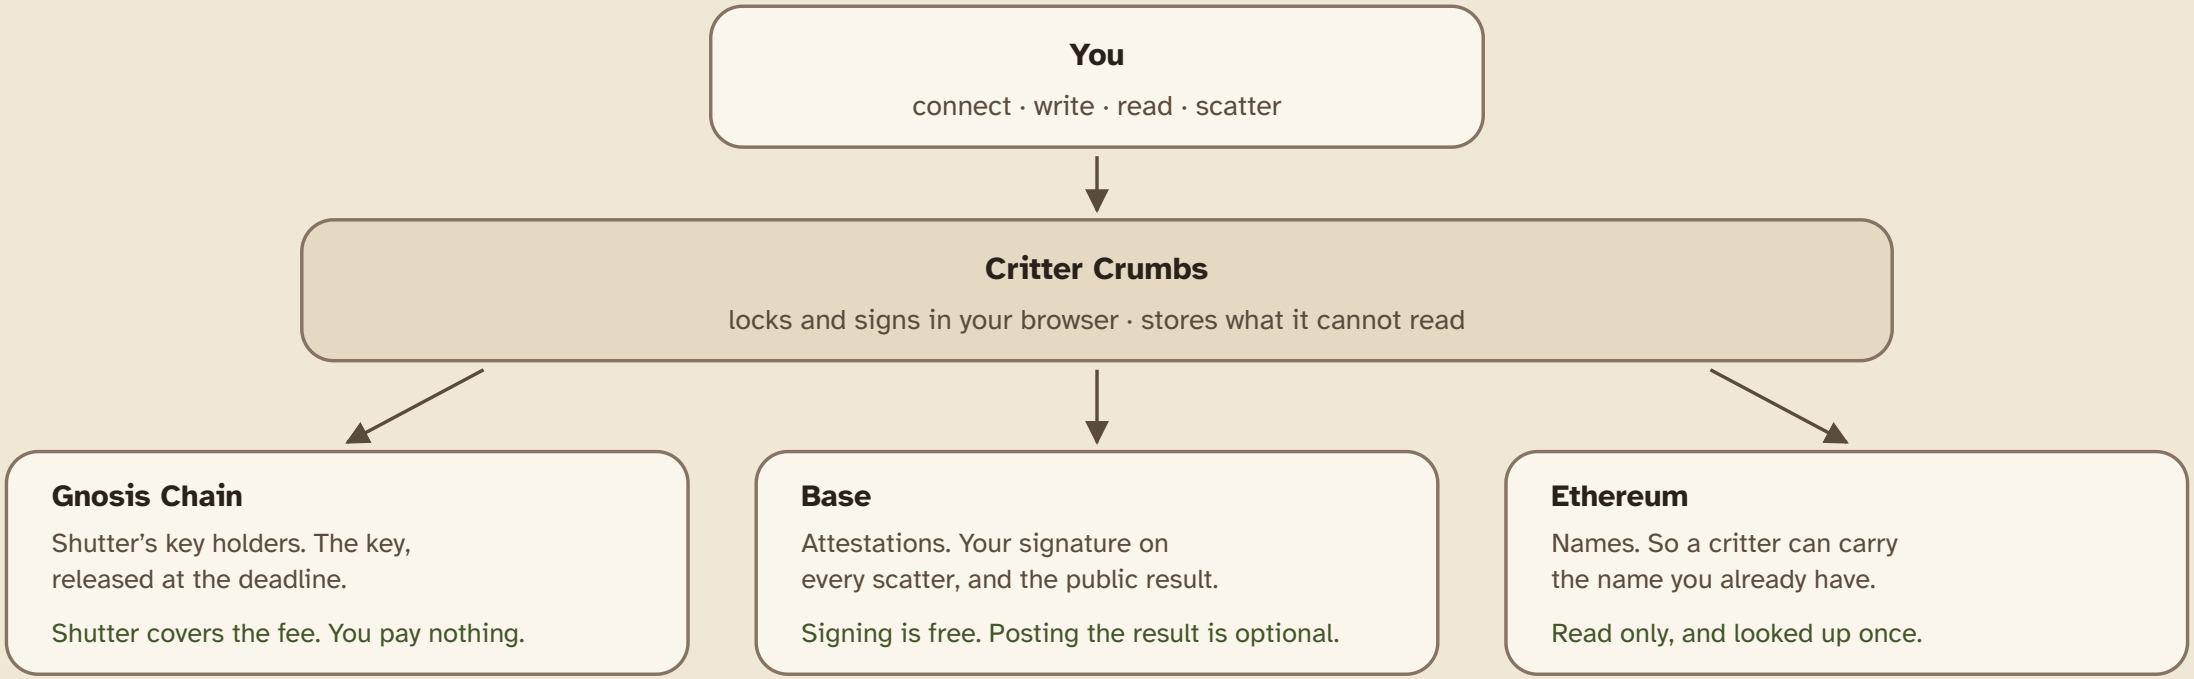

We hold your scatter. We cannot open it.

One thing we will not pretend

Before the feast, nobody can read your scatter, because nobody has the key. Not us, not the creator. After the feast the key exists, so keeping who gave what private becomes a rule we enforce rather than something the lock does for us.

Three chains underneath, and nobody has to notice.

Scatters are signed and held by us, never written to a chain. Only a public result is written down, and that is the one time anyone pays a fee. The key is split across Shutter’s holders, so none of them can open a feast alone.

Where it is now.

Done

The part that has to be right

The encryption, the signatures and the count are built and tested. The half where a mistake would be unrecoverable is behind us.

Now

The game and the interface

The critters' world is being built first, then every screen, then a polish pass over all of them. Before any real money, a full rehearsal with the real people.

October

The first feast

One council of 6–10 across four continents, sharing out real money.

October works if all four of these hold.

Nobody needs help	The feast runs start to finish without anyone asking how it works.
Every scatter arrives	Everyone finds their own on the published list, and every one of them opens.
Everyone sees the same numbers	Any two devices land on the same result, and the public record agrees.
The money can move	The result goes into the budget document without anyone retyping it.

Where it goes next.

Sign in with an email	Nobody ever sees a seed phrase, and nothing on screen mentions a chain. The account layer underneath is already shaped for this, so it is one layer changing rather than a rewrite.
Nobody pays to take part	Fees are sponsored, so the one remaining cost disappears and taking part is free from end to end.
The feast holds the money	A feast takes custody of the funds and lets them go according to its own result, the moment it opens. No operator, no payment run, nobody in the middle deciding.
Help writing your statement	When a feast opens you get a prompt to take to whatever assistant you already use, along with your own notes. It knows the feast, the deadlines and the length limit, and it helps you pull out what you actually did. Your notes never come near us.

Custody is the part worth funding. Before it, this is a tool for deciding. With it, the decision carries itself out.

Ready to feast?
The first one is in October 2026.
